

# Victoria's On-Farm Internet of Things Trial

## What kind of technology will be available to farmers participating in the trial?

This is a summary of the types of technology available to support the trial. Agriculture Victoria is currently finalising the complete list of technology to support the trial. All Apps & Devices in this list are available to all farmers. The coloured icons suggest where the Apps & Devices may be most applicable.

### Informed agronomy

#### Information systems to support decision-making

Compile data into key reports, analysis, alerting and / or decision support. May bring in additional data through free or allied services.

#### Weather monitoring

Monitor weather conditions including air temperature, relative humidity, barometric pressure, wind speed, wind direction, rainfall and solar radiation or photosynthetically active radiation.

#### Soil moisture monitoring

Monitor soil moisture and other soil factors for crop / pasture management. May include soil temperature and macronutrient sensing at a range of depths.

#### Microclimate monitoring

Sensors for specific applications such as leaf wetness, frost, rain gauge, wind speed, wind direction and light sensing.

#### Plant growth monitoring

Measure plant and fruit growth status. Includes stem and fruit diameter using dendrometers. May allow for comparative assessment of block and variety progression and inform harvest timing.

#### Plant stress tracking

Track plant water use and moisture stress for informed management of productivity and fruit quality.

## Production environment data

### Pest monitoring

Enable rapid identification of pest risk to production system.  
Trapping, imaging and alerting of pests for analysis or control.

### Plant disease risk monitoring

Measure crop environment temperature, humidity and leaf wetness to monitor fungal disease risk.

## Farm management

### Asset tracking

Track location, movement and status of equipment.

### Site security monitoring

Monitor building doors or gates, detect motion and / or trigger camera recording of security events.

### Battery condition monitoring

Track remote equipment battery status, power consumption and battery health.

### Staff safety monitoring

Monitor welfare of staff (fall detection, location, panic button), including staff working remotely or in one-up situations.

### Fuel tank level monitoring

Monitor diesel fuel supply volume and actively manage resupply based on current and historical fuel requirement.

### Grain storage monitoring

Monitor and manage grain storage conditions such as temperature and humidity to protect grain quality and germination.

### Silo level monitoring

Monitor grain, feed or fertiliser silo levels for both filling and supply level tracking. Prevent the need and risk to climb silos, save time in filling and reduce overflow spills.

### Animal monitoring

Track location, movement and health status of stock. Factors including location, body temperature, movement types and reproductive status can be monitored.

### Fence monitoring

Monitor fencing to ensure stock are contained to paddock boundaries.

### Milk temperature and process equipment monitoring

Detect milk storage and cleaning temperature factors outside of set points to reduce risk of spoiled milk batches.

### On-farm cold store monitoring

Track humidity and temperature within on-farm cold stores.

# Managing Water

## Water flow measuring

Meters to measure water flow through reticulation systems. Pipeline sensing from 20mm to 100mm, plus channel flow rate metering.

## Tank level monitoring

Remotely monitor water tank levels for stock, irrigation, spraying or domestic supply.

## Water quality monitoring

Monitor water salinity, electrical conductivity and/or pH.

## Pump monitoring and managing

Remotely manage pumping through scheduling or level or pressure switching.

## Dam level monitoring

Remotely monitor dam levels for stock, irrigation, spraying or domestic supply.

## Trough level monitoring

Remotely monitor watering points and inform reticulation supply and repair scheduling.

## Water delivery monitoring

Remotely detect wetting front in soil – especially via flood irrigation.

## Water pressure monitoring

Pressure sensor to remotely confirm pump status in water transfer/delivery.

## Valve controlling

Remotely control reticulation valves for efficient automation of orchard irrigation/fertigation.
